

Fast Park® in Belgrade: the city parking solution on demand

The lack of parking spaces in the centre is a traditional problem of all big cities. In many cases the number of available parking places doesn't meet the needs. The municipality of Belgrade and the public company JKP "Parking Servis" made the best of trying to solve the problem by choosing the Fast Park® system as the effective managing tool for parking facilities. JKP "Parking Servis" possess about 6.500 bays on public parking lots and many existing areas have been rearranged with the Fast Park® deck, thereby enhancing their car-parking capacities. Instead of surface and multi-storey car parks the Fast Park® system offer a wide range of benefits: fast installation, 100% demountable and re-usable, high quality materials, flexibility for split-level land and undulating surfaces and much more.

The already installed structures in the city of Belgrade offer about 800 car parking places and a new one has been recently completed close to the Simpa shopping centre. New parking slots were desperately needed because the car park serves the big shopping centre and the bus station. The constructive phases have been scheduled so as to guarantee at all times an adequate number of spaces, minimising inconvenience for the users. The newly installed deck provides now 132 car parking bays. The city of Belgrade has correctly understood the value of this construction system as a medium-term solution to the obvious pressure on a specific car park in the city centre.
