

## Second FAST PARK® in Mérida

Following to the first opening of a first structure in April 2009, the installation of a second Fast Park® in Mérida, Spain, has been completed these days. The new city parking is located in the heart of the city – in an area of ancient factories “Maderas Leon” traversia Cervantes nearby. It serves the citizens with 140 new car spaces, respecting all site constraints of a worth seeing area. The former boundaries have been kept, a significant effort in design and execution was required, a careful blend with the environment and a soft impact on the existing structures and vehicles have been achieved.

The use of special beams to support the modular roofing system on the top floor reduces the number of columns and increases the span between the car spaces for better maneuvering.

A versatile, reversible work that has been completed in only sixty days. ■
